

1. Current Team Status

How is your team coming together? Have you settled into a working dynamic?

- So far, we have mostly brainstormed the ideas we discussed the first week and continued week 2. Some communication/programming channels we've considered: Git repo, workspaces (Jira, Flask), IDE choice (most likely VSCode).
- We've informally decided we will utilize Java along with an IDE, Framework, and Git Repo that works (still subject to change).
 - The other language we considered was C++
- We've tentatively decided to make a factory-based game as the general project focus. How we will develop this idea is still VERY subject to change.
 - Processes would take place in the game that takes real-life time to complete (ex: one process could take 4 hours real-time)
 - Users can spend to make these processes go by faster

Game engine contenders

- Unreal
- GameMaker
- Unity
- Godot

Current roles we're comfortable with (subject to change):

- Ben – Mostly backend work savvy (Python C++, Java), can connect backend to frontend. Willing to help with front-end workload if needed.
- Jacob – Backend: Java, Python, C++, MySQL; Frontend: HTML (in progress). Also facilitator.
- Kristian – Backend: Java, JavaScript, C++, PHP, Python; Frontend: HTML, CSS
- Jake – Backend: Java, COBOL, SQL, HTML,
- Dillon Opperman – Backend: Java, Python, TS, JS, MySQL; frontend; HTML, CSS, Springboot/bootstrap and React Native (currently learning Swift).
- Josh - Backend: Java, JavaScript, Python – Frontend: HTML, CSS, JavaScript (prefer frontend) Game Engine: Game Maker Studio (some experience)

2. Early Project Ideas

Share any project directions you're exploring. You can mention multiple ideas if you're still deciding. Include any clients or organizations you might be building for.

- Gaming overlay thing – something with details about the game
 - Clash of Clans
 - Monster Hunter
- Accent into standard English interpreter
- AI song completer
- A game with microtransactions
 - Factory game? Like shapes.io?
 - (don't need good graphics)
- Subscription-based service (game, lessons, etc)
 - Travel tips site
 - Mod
 - Minecraft
 - Trivia (user can choose category)
 - Web game with similar premise like snake or wordle (simple, low-commitment, daily-based)
 - Crossword creator (creation, crossword sharing, custom words)
 - Collection of minigames (think like WarioWare)

3. What's Been Done So Far?

Have you set up communication channels, shared drives, GitHub repos, or design docs? Who's done what?

- brainstormed ideas for the project focus with two priorities in mind: 1.) Maximizing profit for the client, and 2.) Keeping the scope within the confines of 10-12 weeks of production.
- Researched ways we can go about making our current agreed upon topic
 - Cobra Code on youtube (focuses 2d with Unreal engine)

To do:

- Meet up and decide what idea(s) we want to take for this project.
 - (what requirements we want, who will do what, etc)
- Set up some communication channel once project focus is finalized.
 - (github repo, workspace, IDE, etc)

4. Team Member Contributions (REQUIRED)

List each team member and what they have contributed so far. Be honest.

(e.g., "Rosa: researching project options," "Malik: created repo," "Sasha: out this week – no update")

- *Dillon Opperman - Created word doc and shared it with the group. Also helped obviously fill out his document (sections 1, 4, 5, 6)*
- *Ben Potter – Helped brainstorm some of the project ideas, helped others figure what skills could be beneficial for the project within their specified roles, and suggest what channels of communication we could roll with for the project. Researched ways we can develop our idea with unreal engine (if applicable).*
- *Jake Beren - Discussed project ideas focusing on what roles each of us will play and how we will achieve project goals*
- *Kristian Neilands – Helped discuss/brainstorm project ideas and identified skills & strengths for each member for roles*
- *Jacob Oswald – Helped brainstorm project ideas, contacted Josh (who was out due to the flu) about what we did in class, somewhat moderated the brainstorming discussion.*
- *Josh Schmidt – Added skills to our document and looked into tools required to make a game*

5. Biggest Question or Unknown Right Now

What's the biggest uncertainty or decision you're facing as a team?

- Lots of good ideas but being able to develop them could be out of the scope or profitability. We need a feasible project that we can ALL actually work on together as a group.

6. Next Step Before Proposal

What will you do in the next 1–2 weeks to prepare for submitting your formal project proposal?

- First of all, make sure we are all in agreement on the final project idea.
- Research ways we can develop our project (especially with an unfamiliar framework in mind)
- Create the workspace, a Git repo, and pick an IDE (mentioned above). Once we have some structure, we can create a solid project outline that should connect all the dots with clear roles defined.
